Read the following passage and mark the letter A, B, C, or D on your answer sheet to indicate the correct answer to each of the questions from 31 to 35.

Today I'd like to begin a discussion on the problem of the heating up the earth. First we'll touch on the relationship between fluorocarbons and the ozone layer. You probably remember that the ozone layer is the protective shield around the earth. It is important to all life, because it filters out harmful ultraviolet light from the sun. Ozone itself, a form of oxygen, is regularly destroyed by natural chemical processes.

The problem now is that too much of the ozone layer is being **destroyed**. Scientists suspect that certain chemicals, such as fluorocarbons, are contributing to the depletion of the ozone layer. And how do we use fluorocarbons? The most common uses are in spray cans and cooling systems. The chemical pollution from these fluorocarbons can account for some of the ozone losses that have been reported. There are, however, new studies linking the sun itself to the depletion of the ozone layer. We'll go into that new study more next time.

Question 31: What is the passage mainly about?

- A. The ultraviolet light
- B. The uses of cooling systems
- C. The ozone layer
- D. The uses of spray cans

Question 32: What does the word “**destroyed**” in paragraph 2 probably mean?

- A. damaged
- B. kept
- C. prevented
- D. stopped

Question 33: Ozone itself is a form of _____.

- A. fluorocarbons
- B. shields
- C. ultraviolet light
- D. oxygen

Question 34: Which of the following is **NOT** true?

- A. Ultraviolet light can be bad for your health
- B. Fluorocarbons are used to produce spray cans and cooling systems
- C. Fluorocarbons can cause the depletion of the ozone layer.
- D. The ozone layer cannot be destroyed by natural chemical processes.

Question 35: The ozone layer helps filter out harmful ultraviolet light from the _____.

- A. sun
- B. earth
- C. shield
- D. chemical
